National 5 Chemistry: Unit 2

Key Area – Homologous Series

Learning Statement									Red	Amber	Green																		
<p>A homologous series is a group of compounds with:</p> <ul style="list-style-type: none"> ○ similar chemical properties ○ the same general formula ○ a gradual change in physical properties such as melting and boiling point. 									<input type="radio"/>	<input type="radio"/>	<input type="radio"/>																		
<p>Examples of homologous series include groups of compounds called the alkanes, cycloalkanes and alkenes.</p>									<input type="radio"/>	<input type="radio"/>	<input type="radio"/>																		
<p>The Alkanes The alkanes are the simplest homologous series of hydrocarbons.</p> <ul style="list-style-type: none"> ○ The names of the first eight alkanes are: <table border="1"> <thead> <tr> <th>No. C's</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>6</th> <th>7</th> <th>8</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>methane</td> <td>ethane</td> <td>propane</td> <td>butane</td> <td>pentane</td> <td>hexane</td> <td>heptane</td> <td>octane</td> </tr> </tbody> </table> <ul style="list-style-type: none"> ○ You need to be able to name and draw the first eight alkanes. <div style="text-align: center;"> </div> <ul style="list-style-type: none"> ○ The names of the alkanes always end in ...ANE. ○ The alkanes contain C-C single bonds. ○ The general formula for the alkanes is C_nH_{2n+2}. 									No. C's	1	2	3	4	5	6	7	8	Name	methane	ethane	propane	butane	pentane	hexane	heptane	octane	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
No. C's	1	2	3	4	5	6	7	8																					
Name	methane	ethane	propane	butane	pentane	hexane	heptane	octane																					
<p>Alkanes can be straight chained like the above, or branched.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>Straight chain</p> </div> <div style="text-align: center;"> <p>Branched</p> </div> </div>									<input type="radio"/>	<input type="radio"/>	<input type="radio"/>																		
<p>Branched alkanes can be named systematically according to rules set down by the International Union of Pure and Applied Chemistry (IUPAC).</p> <ul style="list-style-type: none"> ○ Find the longest continuous chain of carbons ○ Identify any branches off the longest chain, e.g. methyl or ethyl ○ Put the name together with the branches first and the name of the long chain last. <i>The longest chain should be numbered to give branches the lowest possible number.</i> <p>e.g.</p>									<input type="radio"/>	<input type="radio"/>	<input type="radio"/>																		

Here the longest chain is 6 carbons.

There is an ethyl branch on carbon 3 and a methyl branch on carbon 4.

So this is:

3-ethyl-4-methylhexane

The Cycloalkanes

The cycloalkanes are a homologous series of hydrocarbons with cyclic shapes.

- The names of the first five cycloalkanes are:

No. C's	1	2	3	4	5	6	7
Name	Doesn't exist	Doesn't exist	cyclopropane	cyclobutane	cyclopentane	cyclohexane	cycloheptane

- You need to be able to draw and name the cycloalkanes.

- The names of the cycloalkanes start with **CYCLO...** and end with **...ANE**.
- The cycloalkanes contain C-C single bonds.
- The general formula for the cycloalkanes is C_nH_{2n} .

The Alkenes

The alkenes are another homologous series of hydrocarbons.

- The names of the first seven alkenes are:

No. C's	1	2	3	4	5	6	7	8
Name	Doesn't exist	ethene	propene	butene*	pentene*	hexene*	heptene*	octene*

*Names should have numbers to show the position of C=C

- You need to be able to name and draw the alkenes.

- The names of the alkenes always end in **...ENE**.
- The name of alkenes sometimes has a number in it, e.g. pent-1-ene. The number tells us where the C=C is.

This would be:

pent-2-ene

- Alkenes contain at least one C=C double bond. This is called the functional group, which means it is the part of the molecule that reacts.
- The general formula for the alkenes is C_nH_{2n} .

Alkenes can also be straight chain or branched. Branched alkenes are named in the same way we named branched alkanes. The position of the C=C double bond is numbered first and then the branches are numbered in this case however. For example:

5-methylhex-2-ene

An **isomer** is when you have compounds that have the same molecular formula but a different structural formula.

Saturated hydrocarbons contain only C-C single bonds.

- The alkanes are saturated hydrocarbons.
- The cycloalkanes are saturated hydrocarbons.

Unsaturated hydrocarbons contain C=C double bonds.

- The alkenes are unsaturated hydrocarbons.

The bromine solution test can be used to distinguish between saturated and unsaturated hydrocarbons.

- Unsaturated hydrocarbons immediately decolourise bromine solution.
- Saturated hydrocarbons do not immediately decolourise bromine solution.

When an unsaturated hydrocarbon, such as an alkene, reacts with bromine solution a reaction called **ADDITION** has occurred.

The addition of hydrogen to an alkene is called **HYDROGENATION**. Adding hydrogen to an alkene forms an alkane.

The addition of water to an alkene is called **HYDRATION**.

Cracking is when you take a large alkane and break it down into a smaller alkane and a smaller alkene.

The following apparatus can be used to carry out cracking in a laboratory.

 <p>ceramic wool soaked in diesel</p> <p>aluminium oxide</p> <p>heat</p> <p>bromine water decolourises</p>	<p>The aluminium oxide is a catalyst in this reaction.</p> <p>When carrying out the experiment, the delivery tube must be removed from the bromine before you stop heating to prevent suckback.</p>	<table border="1"><tr><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td></tr></table>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>			

National 5 Chemistry: Unit 2

Key Area – Everyday Consumer Products

Learning Statement		Red	Amber	Green																		
Alcohols are a homologous series containing the hydroxyl functional group, -OH.																						
<p>Alcohols can be made by the hydration of alkenes.</p> $ \begin{array}{c} \text{H} & & \text{H} \\ & \backslash & / \\ & \text{C} = \text{C} \\ & / & \backslash \\ \text{H} & & \text{H} \end{array} + \begin{array}{c} \text{H} & \text{O} \\ & / \backslash \\ \text{H} & & \text{H} \end{array} \longrightarrow \begin{array}{c} \text{H} & & \text{H} \\ & & \\ \text{H}-\text{C} & - & \text{C}-\text{OH} \\ & & \\ \text{H} & & \text{H} \end{array} $ <p>Ethene + Water → Ethanol</p> $\text{C}_2\text{H}_4 + \text{H}_2\text{O} \rightarrow \text{C}_2\text{H}_5\text{OH}$																						
<p>Alcohol can also be made by the fermentation of glucose which is catalysed by the enzymes found in yeast.</p> <p style="text-align: center;">Yeast</p> <p style="text-align: center;">glucose → ethanol (alcohol) + carbon dioxide</p>																						
<p>Alcohols</p> <ul style="list-style-type: none"> Are a homologous series of compounds containing the hydroxyl functional group, -OH. The names of the first eight members are: <table border="1" style="width: 100%; text-align: center;"> <thead> <tr> <th>No. Cs</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>6</th> <th>7</th> <th>8</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>methanol</td> <td>ethanol</td> <td>propanol*</td> <td>butanol*</td> <td>pentanol*</td> <td>hexanol*</td> <td>heptanol*</td> <td>octanol*</td> </tr> </tbody> </table> <p style="text-align: center;">*names will also have a number in them telling you the position of the -OH group.</p> <ul style="list-style-type: none"> You need to be able to name and draw the above alcohols. <p style="text-align: center;">Ethanol ↔ $\begin{array}{c} \text{H} & \text{H} \\ & \\ \text{H}-\text{C} & - & \text{C}-\text{O}-\text{H} \\ & \\ \text{H} & \text{H} \end{array}$</p> <ul style="list-style-type: none"> The name of an alcohol ends in ...OL. The general formula for the alcohols is $\text{C}_n\text{H}_{2n+1}\text{OH}$ 		No. Cs	1	2	3	4	5	6	7	8	Name	methanol	ethanol	propanol*	butanol*	pentanol*	hexanol*	heptanol*	octanol*			
No. Cs	1	2	3	4	5	6	7	8														
Name	methanol	ethanol	propanol*	butanol*	pentanol*	hexanol*	heptanol*	octanol*														
<p>In alcohols with more than 3 carbons in their chain, the -OH group can be in different positions on the chain. To show where the -OH group is, we can place a number in the name of the alcohol.</p> <p>For example:</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>Propan-1-ol</p> $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ & & \\ \text{H}-\text{C} & - & \text{C} & - & \text{C}-\text{O}-\text{H} \\ & & \\ \text{H} & \text{H} & \text{H} \end{array}$ </div> <div style="text-align: center;"> <p>Propan-2-ol</p> $\begin{array}{c} \text{H} & \text{H} & \text{H} \\ & & \\ \text{H}-\text{C} & - & \text{C} & - & \text{C}-\text{H} \\ & & \\ \text{H} & \text{O} & \text{H} \\ & & \\ & \text{H} & \end{array}$ </div> </div> <p>Propan-1-ol and propan-2-ol are isomers, as they have the same molecular formula but a different structural formula.</p>																						
Small alcohols such as methanol, ethanol and propanol are soluble in water. Longer carbon																						

chained alcohols are not soluble in water.															
Alcohols are useful as solvents. They are found in a variety of skincare products as some alcohols are able to dissolve the oils present in skin.															
Alcohols are highly flammable, which means they make good fuels.															
Alcohols make good fuels as they burn with a much cleaner flame than hydrocarbon fuels.															
Ethanol, which can be made by fermentation, is becoming more widely used as a fuel for vehicles.															
Alcohols can be converted into another type of chemical, called a carboxylic acid .															
<p>Carboxylic acids are a homologous series of compounds which contain the carboxyl functional group.</p> <p>The carboxyl functional group </p>															
<p>Carboxylic Acids</p> <ul style="list-style-type: none"> Are a homologous series of compounds contain the carboxyl functional group (COOH) The names of the first five members are: <table border="1" data-bbox="97 1055 1228 1164"> <thead> <tr> <th>No. C's</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>methanoic acid</td> <td>ethanoic acid</td> <td>propanoic acid</td> <td>butanoic acid</td> <td>pentanoic acid</td> </tr> </tbody> </table> <ul style="list-style-type: none"> You need to be able to name and draw carboxylic acids <p> propanoic acid</p> <ul style="list-style-type: none"> Their names all end inANOIC ACID. They have the general formula $C_nH_{2n+1}COOH$. 	No. C's	1	2	3	4	5	Name	methanoic acid	ethanoic acid	propanoic acid	butanoic acid	pentanoic acid			
No. C's	1	2	3	4	5										
Name	methanoic acid	ethanoic acid	propanoic acid	butanoic acid	pentanoic acid										
Ethanoic acid is more commonly known as vinegar.															
<p>Carboxylic acids can have a variety of uses:</p> <ul style="list-style-type: none"> as preservatives as cleaning products as they are weak acids in the food industry. 															
Carboxylic acids tend to have an unpleasant smell, e.g. butanoic acid. This acid is formed when butter becomes rancid.															
Carboxylic acids can react with alcohols to form a compound called an ester .															
<p>Alcohol + Carboxylic Acid \rightleftharpoons Ester + Water</p>															

<p>When an ester is made, water is also formed. This type of reaction is called a condensation reaction.</p>			
<p>Esters are compounds which contain an ester functional group. An ester functional group has the following structure.</p> <p style="text-align: center;">The ester functional group</p>  <p>You need to be able to identify this functional group if you are given the structural formula of a substance.</p>			
<p>Esters have sweet smells. They are found in many everyday products.</p>			
<p>Esters have a variety of uses:</p> <ul style="list-style-type: none"> ○ as fragrance compounds ○ as flavourings in foods ○ as cleaning agents ○ as solvents, e.g. nail varnish remover. 			
<p>Esters are found in fats and oils.</p>			

Key Area – Energy from Fuels

Learning Statement	Red	Amber	Green															
A fuel is a substance that can be burned to release energy.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>															
The burning of a fuel is called combustion . Combustion is the reaction of a substance with oxygen, giving out energy.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>															
The burning of a fuel releases energy to the surroundings, so the burning of a fuel is an example of an exothermic reaction.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>															
When a fuel burns oxygen is used up. <ul style="list-style-type: none"> ○ The chemical test for oxygen is that it relights a glowing splint. 	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>															
A fossil fuel is a fuel which is formed over millions of years from the remains of living things. <table border="1" style="margin: 10px auto; border-collapse: collapse; text-align: center;"> <tr> <td colspan="3">Fossil Fuels</td> </tr> <tr> <td>Coal</td> <td>Oil</td> <td>Gas</td> </tr> </table>	Fossil Fuels			Coal	Oil	Gas	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
