

## CIRCLES, SECTORS AND RADIIANS

### SECTORS

The non-shaded area of the circle shown below is called a **SECTOR**.

In this example the **sector** subtends a right-angle ( $90^\circ$ ) at the centre of the circle. The non-shaded area would still be a **sector** if the angle at the centre of the circle was larger, or smaller, than a right-angle ( $90^\circ$ ).

We can see that the non-shaded **sector** is a quarter of the circle, so its area is one quarter of the total area of the circle.

$$\begin{aligned} \text{Area of a sector} &= \frac{1}{4}(\pi R^2) \text{ for this example} \\ &= \frac{1}{4} \times \pi \times 10^2 \\ &= \frac{1}{4} \times 100\pi \\ &= 25\pi \text{ cm}^2 \end{aligned}$$

Since, in this example, the angle subtended by the sector at the centre of the circle is  $90^\circ$  and the angle for a full circle  $360^\circ$  we can calculate the area of the sector as follows.

$$\begin{aligned} \text{Area of sector} &= \frac{90^\circ}{360^\circ} \times (\pi R^2) \\ &= \frac{90^\circ}{360^\circ} \times \pi 10^2 \\ &= \frac{1}{4} \times 100\pi \\ &= 25\pi \text{ cm}^2 \text{ same as before.} \end{aligned}$$

The same argument applies for angles other than  $90^\circ$  and we can state a general formula as:

$$\text{Area of sector} = \frac{\phi}{360}(\pi R^2)$$

Where  $\phi$  is the angle (in degrees) subtended by the sector at the centre of the circle.

**Exercise 1**

Complete the following table:

	Radius	$\phi$	Area of sector
a)	10cm	$60^\circ$	
b)	25mm	$200^\circ$	
c)	10mm		$50\pi \text{ mm}^2$
d)		$30^\circ$	$75\pi \text{ mm}^2$

Now check your answers

So far we have measured the angle, subtended by the sector, in degrees.

**RADIANS**

Another unit of angular measure, used frequently in engineering, is the **RADIAN**.

We are now going to discover how we can calculate the area of a sector when the angle it subtends is measured in radians.

Let's remind ourselves what a radian is.

A radian is defined as:

The angle ( $\phi$ ) subtended at the centre of a circle by an arc of the circle equal in length to the radius.

Now, how many radians are there in a complete circle you may ask yourself? Well, the circumference of a circle is  $2\pi$  times the radius that is  $2\pi R$ , and the angle subtended by one radian is equal to one radius  $R$ . So the number of radians in a complete circle is  $\frac{2\pi R}{R} = 2\pi$  radians, or to put it another way,  $2\pi$  radians =  $360^\circ$

**Exercise 2**

Complete the table

a)	$2\pi$ radians	$360^\circ$
b)	$\pi$ radians	..... <sup>0</sup>
c)	.....radians	$90^\circ$
d)	.....radians	$45^\circ$
e)	1 radian	..... <sup>0</sup>

Now check your answers.

Area of the non-shaded sector is:

$$\begin{aligned} \text{Area} &= \frac{90^\circ}{360^\circ} \times (\pi 10^2) \\ &= \frac{1}{4} \times 100\pi = 25\pi \text{ cm}^2 \end{aligned}$$

But we have previously discovered that  $90^\circ = \frac{\pi}{2}$  radians

And  $360^\circ = 2\pi$  radians

So we can also say

$$\begin{aligned} \text{Area} &= \frac{\frac{\pi}{2} \text{ radians}}{2\pi \text{ radians}} \times (\pi 10^2) \\ &= \frac{1}{4} \times 100\pi = 25\pi \text{ cm}^2 \quad \text{the same as before.} \end{aligned}$$

So it would seem reasonable to assume that:

$$\begin{aligned} \text{Area} &= \frac{\phi \text{ radians}}{2\pi \text{ radians}} \times \pi R^2 \\ &= \frac{\phi}{2\pi} \times \frac{1}{\pi} R^2 \\ &= \frac{1}{2} R^2 \phi \end{aligned} \quad \text{when } \phi \text{ is in radians.}$$

**Area of sector =  $\frac{1}{2} R^2 \phi$  when  $\phi$  is in radians.**

**Exercise 3**

Complete the following table:

	Angle $\phi$	Radius	Area of sector
A	0.8 rads	20mm	.....mm <sup>2</sup>
B	.....rads	10mm	$50\pi$ mm <sup>2</sup>
C	$\frac{\pi}{2}$ rads	.....mm	$400\pi$ mm <sup>2</sup>

Now check your answers.

**Exercise 4**

Calculate the shaded area of the optical shutter blade and convert  $\angle\phi$  to degrees of arc. The angles given are radians ( $^{\circ}$ ). Dimensions in millimetres.

Now check your answers.

**ANSWERS**

**Exercise 1**

	Radius	$\phi$	Area of sector
a)	10cm	$60^\circ$	<b><math>16.67 \pi \text{ cm}^2</math></b> <b><math>52.37 \pi \text{ cm}^2</math></b>
b)	25mm	$200^\circ$	<b><math>347.2 \pi \text{ mm}^2</math></b> <b><math>1091 \text{ mm}^2</math></b>
c)	10mm	<b><math>180^\circ</math></b>	$50 \pi \text{ mm}^2$
d)	<b>30mm</b>	$30^\circ$	$75 \pi \text{ mm}^2$

The Answers are in **bold**.

$$\begin{aligned}
 \text{a) Area of a sector} &= \frac{\phi}{360} \times (\pi R^2) \\
 &= \frac{60}{360} \times \pi 10^2 \\
 &= \frac{1}{6} \times 100 \pi \\
 &= 16.67 \pi \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 \text{b) Area of a sector} &= \frac{\phi}{360} \times (\pi R^2) \\
 &= \frac{200}{360} \times \pi 25^2 \\
 &= \frac{200}{360} \times 625 \pi \\
 &= 347.2 \pi \text{ mm}^2
 \end{aligned}$$

$$\begin{aligned}
 \text{c) Area of sector} &= \frac{\phi}{360} \times (\pi R^2) \\
 50 \pi &= \frac{\phi}{360} \times (\pi 10^2) \\
 \frac{50 \pi \times 360}{100 \pi} &= \phi \\
 \phi &= 180^\circ
 \end{aligned}$$

$$\begin{aligned} \text{d) Area of sector} &= \frac{\phi}{360} \times (\pi R^2) \\ 75\pi &= \frac{30}{360} \times \pi R^2 \end{aligned}$$

$$\frac{75\pi}{\pi} \times \frac{360}{30} = R^2$$

$$R^2 = 900$$

$$R = 30\text{mm}$$

Now return to the text.

### Exercise 2

a)	$2\pi$ radians	$360^{\circ}$
b)	$\pi$ radians	... <b><math>180^{\circ}</math></b>
c)	... $\frac{\pi}{2}$ .....radians	$90^{\circ}$
d)	..... $\frac{\pi}{4}$ ...radians	$45^{\circ}$
e)	1 radian	... <b><math>57.3^{\circ}</math></b>

The Answers are in **bold**.

a) To start you off, you have been given  $2\pi$  radians =  $360^{\circ}$

b) If  $2\pi$  radians =  $360^{\circ}$

$$\text{Then } \pi \text{ radians} = \frac{360^{\circ}}{2} = 180^{\circ}$$

c) If  $180^{\circ} = \pi$  radians

$$\text{Then } 90^{\circ} = \frac{\pi}{2} \text{ radians}$$

d) If  $180^{\circ} = \pi$  radians

$$\text{Then } 45^{\circ} = \frac{\pi}{4} \text{ radians}$$

Similarly  $60^{\circ} = \frac{\pi}{3}$  radians

**These are useful to remember**

$$30^{\circ} = \frac{\pi}{6} \text{ radians}$$

e) If  $\pi$  radians =  $180^\circ$

$$\text{then 1 radian} = \frac{180^\circ}{\pi} = 57.3^\circ$$

$57.3^\circ$  is an easy figure to remember and is accurate for most practical purposes.  
Where greater accuracy is required, use conversion tables or a scientific calculator.

**Now return to the text.**

### Exercise 3

	Angle $\phi$	Radius	Area of sector
A	0.8 rads	20mm	<b>160mm<sup>2</sup></b>
B	.... $\pi$ .rads	10mm	$50 \pi \text{ mm}^2$
C	$\frac{\pi}{2}$ rads	.... <b>40</b> .mm	$400 \pi \text{ mm}^2$

The Answers are in **bold**.

$$\begin{aligned} \text{a) Area of a sector} &= \frac{1}{2} R^2 \phi \\ &= \frac{1}{2} \times 20^2 \times 0.8 \\ &= \frac{1}{2} \times 400 \times 0.8 \\ &= 160\text{mm}^2 \end{aligned}$$

$$\begin{aligned} \text{b) Area of a sector} &= \frac{1}{2} R^2 \phi \\ 50 \pi \text{ mm}^2 &= \frac{1}{2} \times 10^2 \times \phi \end{aligned}$$

$$\frac{50\pi}{\left(\frac{1}{2} \times 10^2\right)} = \phi$$

$$\frac{50\pi}{50} = \phi$$

$$\phi = \pi \text{ radians (or } 180^\circ)$$

c) Area of a sector =  $\frac{1}{2} R^2 \phi$

$$400 \pi \text{ mm}^2 = \frac{1}{2} \times R^2 \times \frac{\pi}{2}$$

$$\frac{400\pi}{\left(\frac{1}{2} \times \frac{\pi}{2}\right)} = R^2$$

$$400 \times 4 = R^2$$

$$1600 = R^2$$

$$R = 40 \text{ mm}$$

Now return to the text.

#### Exercise 4

The shutter blade is made up from a number of sectors with a common centre and it is symmetrical about its centre lines.

a) First let's find the overall blank area.

$$\text{Total area} = \frac{1}{2} R^2 \phi$$

$$= \frac{1}{2} \times 75^2 \times 1.06$$

$$= \frac{1}{2} \times 5625 \times 1.06$$

$$= 2981.25 \text{ mm}^2$$

$$\begin{aligned} \text{Area A} &= \frac{1}{2} R^2 \phi \\ &= \frac{1}{2} \times 12^2 \times 1.06 \\ &= \frac{1}{2} \times 144 \times 1.06 \\ &= 76.32 \text{mm}^2 \end{aligned}$$

Shutter blank area is the difference between these two areas.

$$\begin{aligned} \text{Shutter blank area} &= 2981.25 - 76.32 \\ &= 2904.93 \text{ mm}^2 \end{aligned}$$

b) Now let's find the area of the "window". Again, this is the difference of two sectors

Area of larger sector

$$\begin{aligned} &= \frac{1}{2} R^2 \phi \\ &= \frac{1}{2} \times 65^2 \times 0.7 \\ &= \frac{1}{2} \times 4225 \times 0.7 \\ &= 1478.75 \text{mm}^2 \end{aligned}$$

Area of smaller sector

$$\begin{aligned}
 &= \frac{1}{2} R^2 \phi \\
 &= \frac{1}{2} \times 45^2 \times 0.7 \\
 &= \frac{1}{2} \times 2025 \times 0.7 \\
 &= 708.75 \text{mm}^2
 \end{aligned}$$

The “window” area is the difference between these areas.

$$\text{Window area} = 1478.75 - 708.75 = 770 \text{mm}^2$$

- c) To find the shaded area of the optical shutter, we take the window area from the shutter blank area.

$$\begin{aligned}
 \text{Shaded area} &= 2904.93 - 770 \\
 &= 2134.93 \text{mm}^2
 \end{aligned}$$

- d) Finally we have to convert  $\phi$  to degrees of arc. ( $\phi$  is given as 1.06 radians)  
Remember we have found that 1 radian = 57.3°

To convert radians to degrees, multiply by 57.3

To convert degrees to radians, divide by 57.3

$$\text{So } 1.06 \text{ radians} = 1.06 \times 57.3 = 60.74^\circ$$
